

A New Conformal Theory of Semi-Classical Quantum General Relativity

D. L. Indranu
Karlstad, Sweden
2005

We consider a new four-dimensional formulation of semi-classical quantum general relativity in which the classical space-time manifold, whose intrinsic geometric properties give rise to the effects of gravitation, is allowed to evolve microscopically by means of a conformal function which is assumed to depend on some quantum mechanical wave function. As a result, the theory presented here produces a unified field theory of gravitation and (microscopic) electromagnetism in a somewhat simple, effective manner. In the process, it is seen that electromagnetism is actually an emergent quantum field originating in some kind of stochastic smooth extension (evolution) of the gravitational field in the general theory of relativity.

1. Introduction

We shall show that the introduction of an external parameter, the Planck displacement vector field, that deforms ("maps") the standard general relativistic space-time S_1 into an evolved space-time S_2 yields a theory of general relativity whose space-time structure obeys the semi-classical quantum mechanical law of evolution. In addition, an "already quantized" electromagnetic field arises from our schematic evolution process and automatically appears as an intrinsic geometric object in the space-time S_2 . In the process of evolution, it is seen that from the point of view of the classical space-time S_1 alone, an external deformation takes place, since, by definition, the Planck constant does not belong to its structure. In other words, relative to S_1 , the Planck constant is an external parameter. However from the global point of view of the universal (enveloping) evolution space M_4 , the Planck constant is intrinsic to itself and therefore defines the dynamical evolution of S_1 into S_2 . In this sense, a point in M_4 is not strictly single-valued. Rather, a point in M_4 has a "dimension" depending on the Planck length. Therefore, it belongs to both the space-time S_1 and the space-time S_2 .

2. Construction of a Four-Dimensional Metric-Compatible Evolution Manifold M_4

We first consider the notion of a four-dimensional, universal enveloping manifold M_4 with coordinates x^μ endowed with a *microscopic* deformation structure represented by

an exterior vector field $\phi(x^\mu)$ which maps the enveloped space-time manifold $S_1 \in M_4$ at a certain initial point P_0 onto a new enveloped space-time manifold $S_2 \in M_4$ at a certain point P_1 through the diffeomorphism

$$x^\mu(P_1) = x^\mu(P_0) + l \xi^\mu$$

where $l = \sqrt{\frac{G \hbar}{c^3}} \approx 10^{-33} \text{ cm}$ is the Planck length expressed in terms of the Newtonian gravitational constant G , the Dirac-Planck constant \hbar , and the speed of light in vacuum c , in such a way that

$$\begin{aligned} \phi^\mu &= l \xi^\mu \\ \lim_{\hbar \rightarrow 0} \phi^\mu &= 0 \end{aligned}$$

From its diffeomorphic structure, we therefore see that M_4 is a kind of *strain space*. In general, the space-time S_2 evolves from the space-time S_1 through the non-linear mapping

$$P(\phi): S_1 \rightarrow S_2$$

Note that the exterior vector field ϕ can be expressed as $\phi = \phi^\mu h_\mu = \bar{\phi}^\mu g_\mu$ (the Einstein's summation convention employed throughout this work) where h_μ and g_μ are the sets of basis vectors of the space-times S_1 and S_2 , respectively. (Likewise for ξ .) We remark that S_1 and S_2 are both endowed with metricity through their immersion in M_4 , which we shall now call the *evolution manifold*. Then, the two sets of basis vectors are related by

$$g_\mu = (\delta_\mu^\nu + l \nabla_\mu \xi^\nu) h_\nu$$

or, alternatively, by

$$g_\mu = h_\mu + l (\bar{\nabla}_\mu \bar{\xi}^\nu) g_\nu$$

where δ_μ^ν are the components of the Kronecker delta.

At this point, we have defined the two covariant derivatives with respect to the connections ω of S_1 and Γ of S_2 as follows:

$$\nabla_\lambda A_{\mu\nu\dots}^{\alpha\beta\dots} = \partial_\lambda A_{\mu\nu\dots}^{\alpha\beta\dots} + \omega_{\sigma\lambda}^\alpha A_{\mu\nu\dots}^{\sigma\beta\dots} + \omega_{\sigma\lambda}^\beta A_{\mu\nu\dots}^{\alpha\sigma\dots} + \dots - \omega_{\mu\lambda}^\sigma A_{\sigma\nu\dots}^{\alpha\beta\dots} - \omega_{\nu\lambda}^\sigma A_{\mu\sigma\dots}^{\alpha\beta\dots} - \dots$$

and

$$\bar{\nabla}_\lambda B_{\mu\nu\dots}^{\alpha\beta\dots} = \partial_\lambda B_{\mu\nu\dots}^{\alpha\beta\dots} + \Gamma_{\sigma\lambda}^\alpha B_{\mu\nu\dots}^{\sigma\beta\dots} + \Gamma_{\sigma\lambda}^\beta B_{\mu\nu\dots}^{\alpha\sigma\dots} + \dots - \Gamma_{\mu\lambda}^\sigma B_{\sigma\nu\dots}^{\alpha\beta\dots} - \Gamma_{\nu\lambda}^\sigma B_{\mu\sigma\dots}^{\alpha\beta\dots} - \dots$$

for arbitrary tensor fields A and B , respectively. Here $\partial_\mu = \partial/\partial x^\mu$, as usual. The two covariant derivatives above are equal only in the limit $\hbar \rightarrow 0$.

Furthermore, we assume that the connections ω and Γ are generally asymmetric, and can be decomposed into their symmetric and anti-symmetric parts, respectively, as

$$\omega_{\mu\nu}^\lambda = (h^\lambda, \partial_\nu h_\mu) = \omega_{(\mu\nu)}^\lambda + \omega_{[\mu\nu]}^\lambda$$

and

$$\Gamma_{\mu\nu}^\lambda = (g^\lambda, \partial_\nu g_\mu) = \Gamma_{(\mu\nu)}^\lambda + \Gamma_{[\mu\nu]}^\lambda$$

Here, by (a, b) we shall mean the inner product between the arbitrary vector fields a and b .

Furthermore, by direct calculation we obtain the relation

$$\partial_\nu g_\mu = (\omega_{\mu\nu}^\lambda + l(\nabla_\mu \xi^\sigma) \omega_{\sigma\nu}^\lambda + l \partial_\nu (\nabla_\mu \xi^\lambda)) h_\lambda$$

Hence, setting

$$\begin{aligned} F_{\mu\nu}^\lambda &= \omega_{\mu\nu}^\lambda + l((\nabla_\mu \xi^\sigma) \omega_{\sigma\nu}^\lambda + \partial_\nu (\nabla_\mu \xi^\lambda)) \\ &= \omega_{\mu\nu}^\lambda + l((\nabla_\mu \xi^\sigma) \omega_{\sigma\nu}^\lambda + \partial_\nu \partial_\mu \xi^\lambda + \xi^\sigma \partial_\nu \omega_{\sigma\mu}^\lambda + (\partial_\nu \xi^\sigma) \omega_{\sigma\mu}^\lambda) \end{aligned}$$

we may simply write

$$\partial_\nu g_\mu = F_{\mu\nu}^\lambda h_\lambda$$

Meanwhile, we also have the following inverse relation:

$$h_\mu = (\delta_\mu^\nu - l \bar{\nabla}_\mu \bar{\xi}^\nu) g_\nu$$

Hence we obtain

$$\begin{aligned}
\partial_\nu g_\mu &= (\omega_{\mu\nu}^\lambda + l(\nabla_\mu \xi^\sigma) \omega_{\sigma\nu}^\lambda + l\partial_\nu \partial_\mu \xi^\lambda + l\xi^\sigma \partial_\nu \omega_{\sigma\mu}^\lambda + l(\partial_\nu \xi^\sigma) \omega_{\sigma\mu}^\lambda \\
&\quad - l\omega_{\mu\nu}^\sigma \bar{\nabla}_\sigma \bar{\xi}^\lambda - l(\nabla_\mu \xi^\rho) \omega_{\rho\nu}^\sigma \bar{\nabla}_\sigma \bar{\xi}^\lambda - l(\partial_\nu \partial_\mu \xi^\sigma) \bar{\nabla}_\sigma \bar{\xi}^\lambda \\
&\quad - l\xi^\rho (\partial_\nu \omega_{\rho\mu}^\sigma) \bar{\nabla}_\sigma \bar{\xi}^\lambda - l(\partial_\nu \xi^\rho) \omega_{\rho\mu}^\sigma \bar{\nabla}_\sigma \bar{\xi}^\lambda) g_\lambda
\end{aligned}$$

Using the relation $\partial_\nu g_\mu = \Gamma_{\mu\nu}^\lambda g_\lambda$ (similarly, $\partial_\nu h_\mu = \omega_{\mu\nu}^\lambda h_\lambda$), we obtain the relation between the two connections Γ and ω as follows:

$$\begin{aligned}
\Gamma_{\mu\nu}^\lambda &= \omega_{\mu\nu}^\lambda + l((\nabla_\mu \xi^\sigma) \omega_{\sigma\nu}^\lambda + \partial_\nu \partial_\mu \xi^\lambda + \xi^\sigma \partial_\nu \omega_{\sigma\mu}^\lambda + (\partial_\nu \xi^\sigma) \omega_{\sigma\mu}^\lambda - \omega_{\mu\nu}^\sigma \bar{\nabla}_\sigma \bar{\xi}^\lambda \\
&\quad - (\nabla_\mu \xi^\rho) \omega_{\rho\nu}^\sigma \bar{\nabla}_\sigma \bar{\xi}^\lambda - (\partial_\nu \partial_\mu \xi^\sigma) \bar{\nabla}_\sigma \bar{\xi}^\lambda - \xi^\rho (\partial_\nu \omega_{\rho\mu}^\sigma) \bar{\nabla}_\sigma \bar{\xi}^\lambda \\
&\quad - (\partial_\nu \xi^\rho) \omega_{\rho\mu}^\sigma \bar{\nabla}_\sigma \bar{\xi}^\lambda)
\end{aligned}$$

which is a general non-linear relation in the components of the exterior displacement field ξ . We may now write

$$\Gamma_{\mu\nu}^\lambda = F_{\mu\nu}^\lambda + G_{\mu\nu}^\lambda$$

where, recalling the previous definition of $F_{\mu\nu}^\lambda$, it can be rewritten as

$$F_{\mu\nu}^\lambda = \omega_{\mu\nu}^\lambda + l((\partial_\nu \omega_{\sigma\mu}^\lambda + \omega_{\mu\sigma}^\rho \omega_{\rho\nu}^\lambda) \xi^\sigma + \partial_\nu \partial_\mu \xi^\lambda + (\partial_\mu \xi^\sigma) \omega_{\sigma\nu}^\lambda + (\partial_\nu \xi^\sigma) \omega_{\sigma\mu}^\lambda)$$

and where

$$G_{\mu\nu}^\lambda = -l(\omega_{\mu\nu}^\sigma + l((\nabla_\mu \xi^\rho) \omega_{\rho\nu}^\sigma + \partial_\nu \partial_\mu \xi^\sigma + \xi^\rho \partial_\nu \omega_{\rho\mu}^\sigma + (\partial_\nu \xi^\rho) \omega_{\rho\mu}^\sigma)) \bar{\nabla}_\sigma \bar{\xi}^\lambda$$

At this point, the intrinsic curvature tensors of the space-times S_1 and S_2 are respectively given by

$$K_{\rho\mu\nu}^\sigma = 2(h^\sigma, \partial_{[\mu} \partial_{\nu]} h_\rho) = \partial_\mu \omega_{\rho\nu}^\sigma - \partial_\nu \omega_{\rho\mu}^\sigma + \omega_{\rho\nu}^\lambda \omega_{\lambda\mu}^\sigma - \omega_{\rho\mu}^\lambda \omega_{\lambda\nu}^\sigma$$

and

$$R_{\rho\mu\nu}^\sigma = 2(g^\sigma, \partial_{[\mu} \partial_{\nu]} g_\rho) = \partial_\mu \Gamma_{\rho\nu}^\sigma - \partial_\nu \Gamma_{\rho\mu}^\sigma + \Gamma_{\rho\nu}^\lambda \Gamma_{\lambda\mu}^\sigma - \Gamma_{\rho\mu}^\lambda \Gamma_{\lambda\nu}^\sigma$$

We may also define the following quantities built from the connections $\omega_{\mu\nu}^\lambda$ and $\Gamma_{\mu\nu}^\lambda$:

$$D_{\rho\mu\nu}^\sigma = \partial_\mu \omega_{\rho\nu}^\sigma + \partial_\nu \omega_{\rho\mu}^\sigma + \omega_{\rho\nu}^\lambda \omega_{\lambda\mu}^\sigma + \omega_{\rho\mu}^\lambda \omega_{\lambda\nu}^\sigma$$

and

$$E^{\sigma}_{\rho\mu\nu} = \partial_{\mu} \Gamma_{\rho\nu}^{\sigma} + \partial_{\nu} \Gamma_{\rho\mu}^{\sigma} + \Gamma_{\rho\nu}^{\lambda} \Gamma_{\lambda\mu}^{\sigma} + \Gamma_{\rho\mu}^{\lambda} \Gamma_{\lambda\nu}^{\sigma}$$

from which we may define two additional ‘‘curvatures’’ X and P by

$$X^{\sigma}_{\rho\mu\nu} = (h^{\sigma}, \partial_{\mu} \partial_{\nu} h_{\rho}) = \frac{1}{2} (K^{\sigma}_{\rho\mu\nu} + D^{\sigma}_{\rho\mu\nu}) = \partial_{\mu} \omega_{\rho\nu}^{\sigma} + \omega_{\rho\nu}^{\lambda} \omega_{\lambda\mu}^{\sigma}$$

and

$$P^{\sigma}_{\rho\mu\nu} = (g^{\sigma}, \partial_{\mu} \partial_{\nu} g_{\rho}) = \frac{1}{2} (R^{\sigma}_{\rho\mu\nu} + E^{\sigma}_{\rho\mu\nu}) = \partial_{\mu} \Gamma_{\rho\nu}^{\sigma} + \Gamma_{\rho\nu}^{\lambda} \Gamma_{\lambda\mu}^{\sigma}$$

such that $K^{\sigma}_{\rho\mu\nu} = 2 X^{\sigma}_{\rho[\mu\nu]}$ and $R^{\sigma}_{\rho\mu\nu} = 2 P^{\sigma}_{\rho[\mu\nu]}$.

Now, we see that

$$F^{\lambda}_{(\mu\nu)} = \omega^{\lambda}_{(\mu\nu)} + l \left(\frac{1}{2} D^{\lambda}_{\sigma\mu\nu} \xi^{\sigma} + \partial_{\nu} \partial_{\mu} \xi^{\lambda} + (\partial_{\mu} \xi^{\sigma}) \omega^{\lambda}_{\sigma\nu} + (\partial_{\nu} \xi^{\sigma}) \omega^{\lambda}_{\sigma\mu} \right)$$

and

$$F^{\lambda}_{[\mu\nu]} = \omega^{\lambda}_{[\mu\nu]} + \frac{1}{2} l K^{\lambda}_{\sigma\mu\nu} \xi^{\sigma}$$

In addition, we also have

$$G^{\lambda}_{(\mu\nu)} = l \left(\omega^{\sigma}_{(\mu\nu)} + l \left(\frac{1}{2} D^{\sigma}_{\rho\mu\nu} \xi^{\rho} + \partial_{\nu} \partial_{\mu} \xi^{\sigma} + (\partial_{\mu} \xi^{\rho}) \omega^{\sigma}_{\rho\nu} + (\partial_{\nu} \xi^{\rho}) \omega^{\sigma}_{\rho\mu} \right) \right) \bar{\nabla}_{\sigma} \bar{\xi}^{\lambda}$$

and

$$G^{\lambda}_{[\mu\nu]} = l \left(\omega^{\sigma}_{[\mu\nu]} - \frac{1}{2} l K^{\sigma}_{\rho\mu\nu} \xi^{\rho} \right) \bar{\nabla}_{\sigma} \bar{\xi}^{\lambda}$$

Now, the metric tensor g of the space-time S_1 and the metric tensor h of the space-time S_2 are respectively given by

$$h_{\mu\nu} = (h_{\mu}, h_{\nu})$$

and

$$g_{\mu\nu} = (g_{\mu}, g_{\nu})$$

where the following relations hold:

$$\begin{aligned} h_{\mu\sigma} h^{\nu\sigma} &= \delta_{\mu}^{\nu} \\ g_{\mu\sigma} g^{\nu\sigma} &= \delta_{\mu}^{\nu} \end{aligned}$$

In general, the two conditions $h_{\mu\sigma} g^{\nu\sigma} \neq \delta_{\mu}^{\nu}$ and $g_{\mu\sigma} h^{\nu\sigma} \neq \delta_{\mu}^{\nu}$ must be fulfilled unless $l = 0$ (in the limit $\hbar \rightarrow 0$). Furthermore, we have the metricity conditions

$$\nabla_{\lambda} h_{\mu\nu} = 0$$

and

$$\bar{\nabla}_{\lambda} g_{\mu\nu} = 0$$

However, note that in general, $\bar{\nabla}_{\lambda} h_{\mu\nu} \neq 0$ and $\nabla_{\lambda} g_{\mu\nu} \neq 0$.

Hence, it is straightforward to see that in general, the metric tensor g is related to the metric tensor h by

$$g_{\mu\nu} = h_{\mu\nu} + 2l \nabla_{(\mu} \xi_{\nu)} + l^2 \nabla_{\mu} \xi^{\lambda} \nabla_{\nu} \xi_{\lambda}$$

which in the linear approximation reads

$$g_{\mu\nu} = h_{\mu\nu} + 2l \nabla_{(\mu} \xi_{\nu)}$$

The formal structure of our underlying geometric framework clearly implies that the same structure holds in n dimensions as well.

3. The Conformal Theory

We are now in the position to extract a physical theory of quantum gravity from the geometric framework in the preceding section by considering the following linear conformal mapping:

$$g_{\mu} = e^{\varphi} h_{\mu}$$

where the continuously differentiable scalar function $\varphi(x^{\mu})$ is the generator of the quantum displacement field in the evolution space M_4 and therefore connects the two space-times S_1 and S_2 .

Now, for reasons that will be apparent soon, we shall define the generator φ in terms of the canonical quantum mechanical wave function $\psi(x^\mu)$ as

$$\varphi = \ln(1 + M \psi)^{\frac{1}{2}}$$

where

$$M = \pm \frac{1}{2} l \left(i \frac{m_0 c}{\hbar} \right)^2$$

Here m_0 is the rest mass of the electron. Note that the sign \pm signifies the signature of the space-time used.

Now, we also have the following relations:

$$\begin{aligned} g^\mu &= e^{-\varphi} h^\mu \\ h_\mu &= e^{-\varphi} g_\mu \\ h^\mu &= e^\varphi g^\mu \\ (g_\mu, g^\nu) &= (h_\mu, h^\nu) = \delta_\mu^\nu \\ (g_\mu, h^\nu) &= e^{2\varphi} \delta_\mu^\nu \\ (h_\mu, g^\nu) &= e^{-2\varphi} \delta_\mu^\nu \end{aligned}$$

as well as the conformal transformation

$$g_{\mu\nu} = e^{2\varphi} h_{\mu\nu}$$

Hence

$$g^{\mu\nu} = e^{-2\varphi} h^{\mu\nu}$$

We immediately see that

$$\begin{aligned} g_{\mu\sigma} h^{\nu\sigma} &= e^{2\varphi} \delta_\mu^\nu \\ h_{\mu\sigma} g^{\nu\sigma} &= e^{-2\varphi} \delta_\mu^\nu \end{aligned}$$

At this point, we see that the world-line of the space-time S_2 , $s = \int \sqrt{g_{\mu\nu} dx^\mu dx^\nu}$, is connected to that of the space-time S_1 , $\sigma = \int \sqrt{h_{\mu\nu} dx^\mu dx^\nu}$, through

$$ds = e^{2\varphi} d\sigma$$

Furthermore, from the relation

$$g_{\mu} = (\delta_{\mu}^{\nu} + l \nabla_{\mu} \xi^{\nu}) h_{\nu} = e^{\varphi} h_{\mu}$$

we obtain the important relation

$$l \nabla_{\nu} \xi_{\mu} = (e^{\varphi} - 1) h_{\mu\nu}$$

which means that

$$\Phi_{\mu\nu} = l \nabla_{\nu} \xi_{\mu} = \Phi_{\nu\mu}$$

i.e., the quantum displacement gradient tensor field Φ is symmetric. Hence we may simply call Φ the *quantum strain tensor field*. We also see that the components of the quantum displacement field, $\phi^{\mu} = l \xi^{\mu}$, can now be described by the wave function ψ as

$$\phi_{\mu} = l \partial_{\mu} \psi$$

i.e.,

$$\psi = \psi_0 + \frac{1}{l} \int \phi_{\mu} dx^{\mu}$$

for an arbitrary initial value ψ_0 (which, most conveniently, can be chosen to be 0).

Furthermore, we note that the integrability condition $\Phi_{\mu\nu} = \Phi_{\nu\mu}$ means that the space-time S_1 must now possess a symmetric, linear connection, i.e.,

$$\omega_{\mu\nu}^{\lambda} = \omega_{\nu\mu}^{\lambda} = \frac{1}{2} h^{\sigma\lambda} (\partial_{\nu} h_{\sigma\mu} - \partial_{\sigma} h_{\mu\nu} + \partial_{\mu} h_{\nu\sigma})$$

which are just the Christoffel symbols $\left\{ \begin{matrix} \lambda \\ \mu\nu \end{matrix} \right\}$ in the space-time S_1 . Hence ω is now none other than the symmetric Levi-Civita (Riemannian) connection. Using the metricity condition $\partial_{\lambda} g_{\mu\nu} = \Gamma_{\mu\nu\lambda} + \Gamma_{\nu\mu\lambda}$, i.e.,

$$\partial_{\lambda} g_{\mu\nu} = M h_{\mu\nu} \partial_{\lambda} \psi + (1 + M \psi) (\omega_{\mu\nu\lambda} + \omega_{\nu\mu\lambda})$$

we obtain the mixed form

$$\begin{aligned}\omega_{\lambda\mu\nu} &= \frac{1}{2} (1 + M\psi)^{-1} (\partial_\lambda g_{\mu\nu} - \partial_\mu g_{\nu\lambda} + \partial_\nu g_{\lambda\mu}) \\ &\quad - \frac{1}{2} M (1 + M\psi)^{-1} (h_{\mu\nu} \partial_\lambda \psi - h_{\nu\lambda} \partial_\mu \psi + h_{\lambda\mu} \partial_\nu \psi)\end{aligned}$$

i.e.,

$$\begin{aligned}\omega_{\mu\nu}^\lambda &= \frac{1}{2} (1 + M\psi)^{-1} h^{\lambda\rho} (\partial_\rho g_{\mu\nu} - \partial_\mu g_{\nu\rho} + \partial_\nu g_{\rho\mu}) \\ &\quad - \frac{1}{2} M (1 + M\psi)^{-1} (\delta_\mu^\lambda \partial_\nu \psi + \delta_\nu^\lambda \partial_\mu \psi - h_{\mu\nu} h^{\lambda\rho} \partial_\rho \psi)\end{aligned}$$

It may be noted that we have used the customary convention in which $\Gamma_{\lambda\mu\nu} = g_{\lambda\rho} \Gamma_{\mu\nu}^\rho$ and $\omega_{\lambda\mu\nu} = h_{\lambda\rho} \omega_{\mu\nu}^\rho$.

Now we shall see why we have made the particular choice $\varphi = \ln(1 + M\psi)^{\frac{1}{2}}$. In order to explicitly show that it now possess a *stochastic* part, let us rewrite the components of the metric tensor of the space-time S_2 as

$$g_{\mu\nu} = (1 + M\psi) h_{\mu\nu}$$

Combining this relation with the linearized relation $g_{\mu\nu} = h_{\mu\nu} + 2l \nabla_{(\mu} \xi_{\nu)}$ and contracting the resulting relation, we obtain

$$l D^2 \psi = 2 (e^{2\varphi} - 1) = 2 M \psi$$

where we have defined the differential operator $D^2 = h^{\mu\nu} \nabla_\mu \nabla_\nu$ such that

$$D^2 \psi = h^{\mu\nu} (\partial_\mu \partial_\nu \psi - \omega_{\mu\nu}^\rho \partial_\rho \psi)$$

Expressing M explicitly, we obtain $D^2 \psi = \mp \left(\frac{m_0 c}{\hbar} \right)^2 \psi$, i.e.,

$$\left(D^2 \pm \left(\frac{m_0 c}{\hbar} \right)^2 \right) \psi = 0$$

which is precisely the *Klein-Gordon equation in the presence of gravitation*.

We may note that, had we combined the relation $g_{\mu\nu} = (1 + M\psi) h_{\mu\nu}$ with the fully non-linear relation $g_{\mu\nu} = h_{\mu\nu} + 2l\nabla_{(\mu}\xi_{\nu)} + l^2\nabla_{\mu}\xi^{\lambda}\nabla_{\nu}\xi_{\lambda}$, we would have obtained the following *non-linear* Klein-Gordon equation:

$$\left(D^2 \pm \left(\frac{m_0 c}{\hbar}\right)^2\right)\psi = l^2 h^{\rho\sigma} h^{\mu\nu} (\nabla_{\rho}\nabla_{\mu}\psi)(\nabla_{\sigma}\nabla_{\nu}\psi)$$

Now, from the general relation between the connections Γ and ω given in Section 2, we obtain the following important relation:

$$\Gamma_{[\mu\nu]}^{\lambda} = -\frac{1}{2}l(\delta_{\sigma}^{\lambda} - l\bar{\nabla}_{\sigma}\bar{\xi}^{\lambda})K^{\sigma}_{\rho\mu\nu}\xi^{\rho}$$

which not only connects the torsion of the space-time S_2 with the curvature of the space-time S_1 , but also describes the torsion as an intrinsic (geometric) quantum phenomenon. Note that

$$K^{\sigma}_{\rho\mu\nu} = \partial_{\mu}\left\{\begin{matrix}\sigma \\ \rho\nu\end{matrix}\right\} - \partial_{\nu}\left\{\begin{matrix}\sigma \\ \rho\mu\end{matrix}\right\} + \left\{\begin{matrix}\lambda \\ \rho\nu\end{matrix}\right\}\left\{\begin{matrix}\sigma \\ \lambda\mu\end{matrix}\right\} - \left\{\begin{matrix}\lambda \\ \rho\mu\end{matrix}\right\}\left\{\begin{matrix}\sigma \\ \lambda\nu\end{matrix}\right\}$$

are now the components of the Riemann-Christoffel curvature tensor describing the curvature of space-time in the standard general relativity theory.

Furthermore, using the relation between the two sets of basis vectors g_{μ} and h_{μ} , it is easy to see that the connection Γ is *semi-symmetric* as

$$\Gamma_{\mu\nu}^{\lambda} = \omega_{\mu\nu}^{\lambda} + \delta_{\mu}^{\lambda}\partial_{\nu}\varphi$$

or, written somewhat more explicitly,

$$\Gamma_{\mu\nu}^{\lambda} = \frac{1}{2}h^{\sigma\lambda}(\partial_{\nu}h_{\sigma\mu} - \partial_{\sigma}h_{\mu\nu} + \partial_{\mu}h_{\nu\sigma}) + \frac{1}{2}\delta_{\mu}^{\lambda}\partial_{\nu}(\ln(1 + M\psi))$$

We immediately obtain

$$\Gamma_{(\mu\nu)}^{\lambda} = \omega_{\mu\nu}^{\lambda} + \frac{1}{2}(\delta_{\mu}^{\lambda}\partial_{\nu}\varphi + \delta_{\nu}^{\lambda}\partial_{\mu}\varphi)$$

and

$$\Gamma_{[\mu\nu]}^\lambda = \frac{1}{2} (\delta_\mu^\lambda \partial_\nu \varphi - \delta_\nu^\lambda \partial_\mu \varphi)$$

Additionally, using the relation

$$\omega_{\nu\mu}^\nu = \omega_{\mu\nu}^\nu = \partial_\mu (\ln \sqrt{\det(h)}) = \partial_\mu (\ln(e^{-\varphi} \sqrt{\det(g)})) = \partial_\mu (\ln \sqrt{\det(g)}) - \partial_\mu \varphi$$

we may now define two *semi-vectors* by the following contractions:

$$\begin{aligned} \Gamma_\mu &= \Gamma_{\nu\mu}^\nu = \partial_\mu (\ln \sqrt{\det(h)}) + 4 \partial_\mu \varphi \\ \Delta_\mu &= \Gamma_{\mu\nu}^\nu = \partial_\mu (\ln \sqrt{\det(h)}) + \partial_\mu \varphi \end{aligned}$$

or, written somewhat more explicitly,

$$\begin{aligned} \Gamma_\mu &= \partial_\mu (\ln \sqrt{\det(h)} + \ln(1 + M\psi)^2) \\ \Delta_\mu &= \partial_\mu (\ln \sqrt{\det(h)} + \ln \sqrt{1 + M\psi}) \end{aligned}$$

We now define the *torsion vector* by

$$\tau_\mu = \Gamma_{[\nu\mu]}^\nu = \frac{3}{2} \partial_\mu \varphi$$

In other words,

$$\tau_\mu = \frac{3}{4} \frac{M}{(1 + M\psi)} \partial_\mu \psi$$

Furthermore, it is easy to show that the curvature tensors of our two space-times S_1 and S_2 are now identical:

$$R_{\rho\mu\nu}^\sigma = K_{\rho\mu\nu}^\sigma$$

which is another way of saying that the conformal transformation $g_\mu = e^\varphi h_\mu$ leaves the curvature tensor of the space-time S_1 invariant. As an immediate consequence, we obtain the ordinary expression

$$R_{\rho\sigma\mu\nu} = \frac{1}{2} (\partial_\mu \partial_\sigma h_{\rho\nu} + \partial_\nu \partial_\rho h_{\sigma\mu} - \partial_\nu \partial_\sigma h_{\rho\mu} - \partial_\mu \partial_\rho h_{\sigma\nu}) + h_{\alpha\beta} (\omega_{\rho\nu}^\alpha \omega_{\sigma\mu}^\beta - \omega_{\rho\mu}^\alpha \omega_{\sigma\nu}^\beta)$$

Hence the following cyclic symmetry in Riemannian geometry:

$$R_{\rho\sigma\mu\nu} + R_{\rho\mu\nu\sigma} + R_{\rho\nu\sigma\mu} = 0$$

is preserved in the presence of torsion. In addition, besides the obvious symmetry $R_{\rho\sigma\mu\nu} = -R_{\rho\nu\sigma\mu}$, we also have the symmetry

$$R_{\rho\sigma\mu\nu} = -R_{\sigma\rho\mu\nu}$$

which is due to the metricity condition of the space-times S_1 and S_2 . This implies the vanishing of the so-called Homothetic curvature as

$$H_{\mu\nu} = R^\sigma_{\sigma\mu\nu} = 0$$

The Weyl tensor is given in the usual manner by

$$C_{\rho\sigma\mu\nu} = R_{\rho\sigma\mu\nu} - \frac{1}{2} (h_{\rho\mu} R_{\sigma\nu} + h_{\sigma\nu} R_{\rho\mu} - h_{\rho\nu} R_{\sigma\mu} - h_{\sigma\mu} R_{\rho\nu}) - \frac{1}{6} (h_{\rho\nu} h_{\sigma\mu} - h_{\rho\mu} h_{\sigma\nu}) R$$

where $R_{\mu\nu} = R^\sigma_{\mu\sigma\nu}$ are the components of the symmetric Ricci tensor and $R = R^\mu_{\mu}$ is the Ricci scalar.

Now, by means of the conformal relation $g_{\mu\nu} = e^{2\varphi} h_{\mu\nu}$ we obtain the expression

$$\begin{aligned} R_{\rho\sigma\mu\nu} = e^{-2\varphi} & \left(\partial_\mu \partial_\sigma g_{\rho\nu} + \partial_\nu \partial_\rho g_{\sigma\mu} - \partial_\nu \partial_\sigma g_{\rho\mu} - \partial_\mu \partial_\rho g_{\sigma\nu} + g_{\alpha\beta} (\Gamma_{\rho\nu}^\alpha \Gamma_{\sigma\mu}^\beta - \Gamma_{\rho\mu}^\alpha \Gamma_{\sigma\nu}^\beta) \right. \\ & + (\partial_\mu g_{\sigma\nu} - \partial_\nu g_{\sigma\mu}) \partial_\rho \varphi + (\partial_\nu g_{\rho\mu} - \partial_\mu g_{\rho\nu}) \partial_\sigma \varphi \\ & + (\partial_\rho g_{\sigma\nu} - \partial_\sigma g_{\rho\nu}) \partial_\mu \varphi + (\partial_\sigma g_{\rho\mu} - \partial_\rho g_{\sigma\mu}) \partial_\nu \varphi \\ & + g_{\sigma\nu} \partial_\mu \partial_\rho \varphi + g_{\rho\mu} \partial_\nu \partial_\sigma \varphi - g_{\rho\nu} \partial_\mu \partial_\sigma \varphi - g_{\mu\sigma} \partial_\nu \partial_\rho \varphi \\ & + 2 (g_{\sigma\mu} \partial_\rho \varphi \partial_\nu \varphi + g_{\rho\nu} \partial_\mu \varphi \partial_\sigma \varphi - g_{\sigma\nu} \partial_\rho \varphi \partial_\mu \varphi - g_{\rho\mu} \partial_\sigma \varphi \partial_\nu \varphi) \\ & \left. + g_{\alpha\beta} \left((\Gamma_{\rho\mu}^\alpha \partial_\nu \varphi - \Gamma_{\rho\nu}^\alpha \partial_\mu \varphi) \delta_\sigma^\beta - (\Gamma_{\sigma\mu}^\beta \partial_\nu \varphi - \Gamma_{\sigma\nu}^\beta \partial_\mu \varphi) \delta_\rho^\alpha \right) \right) \end{aligned}$$

Note that despite the fact that the curvature tensor of the space-time S_2 is identical to that of the space-time S_1 and that both curvature tensors share common algebraic symmetries, the Bianchi identity in S_2 is not the same as the ordinary Bianchi identity in the torsion-free space-time S_1 . Instead, we have the following *generalized* Bianchi identity:

$$\bar{\nabla}_\lambda R_{\rho\sigma\mu\nu} + \bar{\nabla}_\mu R_{\rho\sigma\nu\lambda} + \bar{\nabla}_\nu R_{\rho\sigma\lambda\mu} = 2 \left(\Gamma_{[\mu\nu]}^\eta R_{\rho\sigma\eta\lambda} + \Gamma_{[\nu\lambda]}^\eta R_{\rho\sigma\eta\mu} + \Gamma_{[\lambda\mu]}^\eta R_{\rho\sigma\eta\nu} \right)$$

Contracting the above relation, we obtain

$$\bar{\nabla}_\mu \left(R^{\mu\nu} - \frac{1}{2} g^{\mu\nu} R \right) = 2 g^{\rho\nu} \Gamma_{[\lambda\rho]}^\sigma R^\lambda_\sigma + \Gamma_{[\rho\sigma]}^\lambda R^{\rho\sigma}_\lambda$$

Combining the two generalized Bianchi identities above with the relation $\Gamma_{[\mu\nu]}^\lambda = \frac{1}{2} (\delta_\mu^\lambda \partial_\nu \varphi - \delta_\nu^\lambda \partial_\mu \varphi)$, as well as recalling the definition of the torsion vector, and taking into account the symmetry of the Ricci tensor, we obtain

$$\bar{\nabla}_\lambda R_{\rho\sigma\mu\nu} + \bar{\nabla}_\mu R_{\rho\sigma\nu\lambda} + \bar{\nabla}_\nu R_{\rho\sigma\lambda\mu} = 2 (R_{\rho\sigma\mu\nu} \partial_\lambda \varphi + R_{\rho\sigma\nu\lambda} \partial_\mu \varphi + R_{\rho\sigma\lambda\mu} \partial_\nu \varphi)$$

and

$$\bar{\nabla}_\nu \left(R^{\mu\nu} - \frac{1}{2} g^{\mu\nu} R \right) = -2 \left(R^{\mu\nu} - \frac{1}{2} g^{\mu\nu} R \right) \partial_\nu \varphi$$

which, upon recalling the definition of the torsion vector, may be expressed as

$$\bar{\nabla}_\nu \left(R^{\mu\nu} - \frac{1}{2} g^{\mu\nu} R \right) = -\frac{4}{3} \left(R^{\mu\nu} - \frac{1}{2} g^{\mu\nu} R \right) \tau_\nu$$

Apart from the above generalized identities, we may also give the ordinary Bianchi identities as

$$\nabla_\lambda R_{\rho\sigma\mu\nu} + \nabla_\mu R_{\rho\sigma\nu\lambda} + \nabla_\nu R_{\rho\sigma\lambda\mu} = 0$$

and

$$\nabla_\nu \left(R^{\mu\nu} - \frac{1}{2} h^{\mu\nu} R \right) = 0$$

4. The Electromagnetic Sector of the Conformal Theory. The Fundamental Equations of Motion

Based on the results obtained in the preceding section, let us now take the generator φ as describing the (quantum) electromagnetic field. Then, consequently, the space-time S_1 is understood as being *devoid* of electromagnetic interaction. As we will see, in our present theory, it is the quantum evolution of the gravitational field that gives rise to electromagnetism. In this sense, the electromagnetic field is but an *emergent* quantum phenomenon in the evolution space M_4 .

Whereas the space-time S_1 is purely gravitational, the *evolved* space-time S_2 does contain an electromagnetic field. In our present theory, for reasons that will be clear soon,

we shall define the electromagnetic field $F \in S_2 \in M_4$ in terms of the *torsion* of the space-time S_2 by

$$F_{\mu\nu} = 2 \frac{m_0 c^2}{\bar{e}} \Gamma_{[\mu\nu]}^\lambda u_\lambda$$

where \bar{e} is the (elementary) charge of the electron and

$$u_\mu = g_{\mu\nu} \frac{dx^\nu}{ds} = e^{2\varphi} h_{\mu\nu} \frac{dx^\nu}{ds}$$

are the covariant components of the tangent velocity vector field satisfying $u_\mu u^\mu = 1$.

We have seen that the space-time S_2 possesses a manifest quantum structure through its evolution from the purely gravitational space-time S_1 . This means that \bar{e} may be defined in terms of the fundamental Planck charge \hat{e} as follows:

$$\bar{e} = N \hat{e} = N \sqrt{4\pi \varepsilon_0 \hbar c}$$

where N is a positive constant and ε_0 is the permittivity of free space. Further investigation shows that $N = \sqrt{\alpha}$ where $\alpha^{-1} \approx 137$ is the conventional fine structure constant.

Let us now proceed to show that the geodesic equation of motion in the space-time S_2 gives the (generalized) Lorentz equation of motion for the electron. The result of parallel-transferring the velocity vector field u along the world-line (in the direction of motion of the electron) yields

$$\frac{\bar{D} u^\mu}{ds} = (\bar{\nabla}_\nu u^\mu) u^\nu = 0$$

i.e.,

$$\frac{du^\mu}{ds} + \Gamma_{\rho\sigma}^\mu u^\rho u^\sigma = 0$$

where, in general,

$$\Gamma_{\mu\nu}^\lambda = \frac{1}{2} g^{\sigma\lambda} (\partial_\nu g_{\sigma\mu} - \partial_\sigma g_{\mu\nu} + \partial_\mu g_{\nu\sigma}) + \Gamma_{[\mu\nu]}^\lambda - g^{\lambda\rho} (g_{\mu\sigma} \Gamma_{[\rho\nu]}^\sigma + g_{\nu\sigma} \Gamma_{[\rho\mu]}^\sigma)$$

Recalling our expression for the components of the torsion tensor in the preceding section, we obtain

$$\Gamma_{\mu\nu}^{\lambda} = \frac{1}{2} g^{\sigma\lambda} (\partial_{\nu} g_{\sigma\mu} - \partial_{\sigma} g_{\mu\nu} + \partial_{\mu} g_{\nu\sigma}) + g_{\mu\nu} g^{\lambda\sigma} \partial_{\sigma} \varphi - \delta_{\nu}^{\lambda} \partial_{\mu} \varphi$$

which is completely equivalent to the previously obtained relation $\Gamma_{\mu\nu}^{\lambda} = \omega_{\mu\nu}^{\lambda} + \delta_{\mu}^{\lambda} \partial_{\nu} \varphi$. Note that

$$\Delta_{\mu\nu}^{\lambda} = \frac{1}{2} g^{\sigma\lambda} (\partial_{\nu} g_{\sigma\mu} - \partial_{\sigma} g_{\mu\nu} + \partial_{\mu} g_{\nu\sigma})$$

are the Christoffel symbols in the space-time S_2 . These are not to be confused with the Christoffel symbols in the space-time S_1 given by $\omega_{\mu\nu}^{\lambda}$.

Furthermore, we have

$$\frac{du^{\mu}}{ds} + \Delta_{\rho\sigma}^{\mu} u^{\rho} u^{\sigma} = 2 g^{\mu\rho} \Gamma_{[\rho\sigma]}^{\lambda} u_{\lambda} u^{\sigma}$$

Now, since we have set $F_{\mu\nu} = 2 \frac{m_0 c^2}{\bar{e}} \Gamma_{[\mu\nu]}^{\lambda} u_{\lambda}$, we obtain the equation of motion

$$m_0 c^2 \left(\frac{du^{\mu}}{ds} + \Delta_{\rho\sigma}^{\mu} u^{\rho} u^{\sigma} \right) = \bar{e} F_{\nu}^{\mu} u^{\nu}$$

which is none other than the Lorentz equation of motion for the electron in the presence of gravitation. Hence, it turns out that the electromagnetic field, which is non-existent in the space-time S_1 , is an *intrinsic geometric object* in the space-time S_2 . In other words, the space-time structure of S_2 inherently contains both gravitation and electromagnetism.

Now, we see that

$$F_{\mu\nu} = \frac{m_0 c^2}{\bar{e}} (u_{\mu} \partial_{\nu} \varphi - u_{\nu} \partial_{\mu} \varphi)$$

In other words,

$$\bar{e} F_{\nu}^{\mu} u^{\nu} = m_0 c^2 \left(u^{\mu} \frac{d\varphi}{ds} - g^{\mu\nu} \partial_{\nu} \varphi \right)$$

Consequently, we can rewrite the electron's equation of motion as

$$\frac{du^\mu}{ds} + \Delta_{\rho\sigma}^\mu u^\rho u^\sigma = u^\mu \frac{d\varphi}{ds} - g^{\mu\nu} \partial_\nu \varphi$$

We may therefore define an *asymmetric fundamental tensor of the gravoelectromagnetic manifold* S_2 by

$$\tilde{g}_{\mu\nu} = g_{\mu\nu} \frac{d\varphi}{ds} - \frac{\bar{e}}{m_0 c^2} F_{\mu\nu}$$

satisfying

$$\tilde{g}_{\mu\nu} u^\nu = \partial_\mu \varphi$$

It follows immediately that

$$\left(\delta_\nu^\mu \frac{d\varphi}{ds} - \frac{\bar{e}}{m_0 c^2} F_{\mu\nu} \right) u^\nu = g^{\mu\nu} \partial_\nu \varphi$$

which, when expressed in terms of the wave function ψ , gives the *Schrödinger-like* equation

$$u_\mu \frac{d\psi}{ds} = \frac{1}{M} \left(\partial_\mu \varphi + \frac{\bar{e}}{m_0 c^2} F_{\mu\nu} u^\nu \right) \psi$$

We may now proceed to show that the electromagnetic current density given by the covariant expression

$$j^\mu = -\frac{c}{4\pi} \bar{\nabla}_\nu F^{\mu\nu}$$

is conserved in the present theory.

Let us first call the following expression for the covariant components of the electromagnetic field tensor in terms of the covariant components of the canonical electromagnetic four-potential A :

$$F_{\mu\nu} = \bar{\nabla}_\nu A_\mu - \bar{\nabla}_\mu A_\nu$$

such that $\bar{e} \bar{\nabla}_\nu A_\mu = m_0 c^2 u_\mu \partial_\nu \varphi$, i.e.,

$$m_0 c^2 \partial_\mu \varphi = \bar{e} u^\nu \bar{\nabla}_\mu A_\nu$$

which directly gives the equation of motion

$$m_0 c^2 \frac{d\varphi}{ds} = \bar{e} u^\mu u^\nu \bar{\nabla}_\mu A_\nu$$

Hence, we obtain the following equation of state:

$$m_0 c^2 \frac{d\psi}{ds} = 2\bar{e} \frac{(1 + M\psi)}{M} u^\mu u^\nu \bar{\nabla}_\mu A_\nu$$

Another alternative expression for the electromagnetic field tensor is given by

$$\begin{aligned} F_{\mu\nu} &= \partial_\nu A_\mu - \partial_\mu A_\nu - 2 \Gamma_{[\mu\nu]}^\lambda A_\lambda \\ &= \partial_\nu A_\mu - \partial_\mu A_\nu + A_\nu \partial_\mu \varphi - A_\mu \partial_\nu \varphi \end{aligned}$$

In the particular case in which the field-lines of the electromagnetic four-potential propagate in the direction of the electron's motion, we have

$$F_{\mu\nu} = \Lambda \frac{\bar{e}}{\left(1 - \frac{\beta^2}{c^2}\right)} (\partial_\nu u_\mu - \partial_\mu u_\nu)$$

where Λ is a proportionality constant and $\beta = \pm \bar{e} \sqrt{\frac{\Lambda}{m_0}}$. Then, we may define a vortical velocity field, i.e., a spin field, through the vorticity tensor which is given by

$$\omega_{\mu\nu} = \frac{1}{2} (\partial_\nu u_\mu - \partial_\mu u_\nu)$$

and hence

$$F_{\mu\nu} = 2\Lambda \frac{\bar{e}}{\left(1 - \frac{\beta^2}{c^2}\right)} \omega_{\mu\nu}$$

which describes an electrically charged spinning region in the *space-time continuum* S_2 .

Furthermore, we have the following generalized identity for the electromagnetic field tensor:

$$\bar{\nabla}_\lambda F_{\mu\nu} + \bar{\nabla}_\mu F_{\nu\lambda} + \bar{\nabla}_\nu F_{\lambda\mu} = 2 \left(\Gamma_{[\mu\nu]}^\sigma F_{\sigma\lambda} + \Gamma_{[\nu\lambda]}^\sigma F_{\sigma\mu} + \Gamma_{[\lambda\mu]}^\sigma F_{\sigma\nu} \right)$$

which, in the present theory, takes the particular form

$$\bar{\nabla}_\lambda F_{\mu\nu} + \bar{\nabla}_\mu F_{\nu\lambda} + \bar{\nabla}_\nu F_{\lambda\mu} = 2 \left(F_{\mu\nu} \partial_\lambda \varphi + F_{\nu\lambda} \partial_\mu \varphi + F_{\lambda\mu} \partial_\nu \varphi \right)$$

Contracting, we have

$$\bar{\nabla}_\mu j^\mu = -\frac{c}{4\pi} \bar{\nabla}_\mu \left(\Gamma_{[\rho\sigma]}^\mu F^{\rho\sigma} \right)$$

We therefore expect that the expression in the brackets indeed vanishes. For this purpose, we may set

$$j^\mu = -\frac{c}{4\pi} \Gamma_{[\rho\sigma]}^\mu F^{\rho\sigma}$$

and hence, again, using the relation $\Gamma_{[\mu\nu]}^\lambda = \frac{1}{2} \left(\delta_\mu^\lambda \partial_\nu \varphi - \delta_\nu^\lambda \partial_\mu \varphi \right)$, we immediately see that

$$\begin{aligned} \bar{\nabla}_\mu j^\mu &= -\frac{c}{4\pi} \left(\partial_\nu \varphi \bar{\nabla}_\mu F^{\mu\nu} + F^{\mu\nu} \left(\partial_\nu \partial_\mu \varphi - \Gamma_{[\mu\nu]}^\lambda \partial_\lambda \varphi \right) \right) \\ &= -j^\mu \partial_\mu \varphi - \frac{c}{4\pi} \Gamma_{[\mu\nu]}^\lambda F^{\mu\nu} \partial_\lambda \varphi \end{aligned}$$

i.e.,

$$\bar{\nabla}_\mu j^\mu = 0$$

At this point, we may note the following: the fact that our theory employs torsion, from which the electromagnetic field is extracted, and at the same time guarantees electromagnetic charge conservation (in the form of the above continuity equation) in a natural manner is a remarkable property.

Now, let us call the relation

$$\Gamma_{[\mu\nu]}^\lambda = -\frac{1}{2} l \left(\delta_\sigma^\lambda - l \bar{\nabla}_\sigma \bar{\xi}^\lambda \right) R_{\rho\mu\nu}^\sigma \xi^\rho$$

obtained in Section 3 of this work (in which $R_{\rho\mu\nu}^\sigma = K_{\rho\mu\nu}^\sigma$). This can simply be written as

$$\Gamma_{[\mu\nu]}^\lambda = -\frac{1}{2} l e^{-\varphi} R^\lambda_{\rho\mu\nu} \xi^\rho$$

i.e.,

$$\Gamma_{[\mu\nu]}^\lambda = -\frac{1}{2} l e^{-\varphi} R^\lambda_{\rho\mu\nu} g^{\rho\sigma} \partial_\sigma \psi$$

Hence, we obtain the elegant result

$$F_{\mu\nu} = -l \frac{m_0 c^2}{\bar{e}} e^{-\varphi} R^\lambda_{\rho\mu\nu} u_\lambda g^{\rho\sigma} \partial_\sigma \psi$$

i.e.,

$$F_{\mu\nu} = -\frac{l}{\bar{e}} \frac{m_0 c^2}{\sqrt{1+M\psi}} R^\lambda_{\rho\mu\nu} u_\lambda g^{\rho\sigma} \partial_\sigma \psi$$

or, in terms of the components of the (dimensionless) microscopic displacement field ξ ,

$$F_{\mu\nu} = -l \frac{m_0 c^2}{\bar{e}} e^{-\varphi} R^\lambda_{\rho\mu\nu} u_\lambda g^{\rho\sigma} \xi_\sigma$$

which further reveals *how the electromagnetic field originates in the gravitational field in the space-time S_2 as a quantum field*. Hence, at last, we see a complete picture of the electromagnetic field as an emergent phenomenon. This completes the long-cherished hypothesis that the electromagnetic field itself is caused by a *massive* charged particle, i.e., when $m_0 = 0$ neither gravity nor electromagnetism can exist. Finally, with this result at hand, we obtain the following equation of motion for the electron in the gravitational field:

$$\frac{du^\mu}{ds} + \Delta^\mu_{\rho\sigma} u^\rho u^\sigma = -l e^{-\varphi} R^{\rho\sigma\mu}_\nu u_\rho \xi_\sigma u^\nu$$

i.e.,

$$\frac{du^\mu}{ds} + \Delta^\mu_{\rho\sigma} u^\rho u^\sigma = -\frac{l}{\sqrt{1+M\psi}} R^{\rho\sigma\mu}_\nu u_\rho u^\nu \partial_\sigma \psi$$

In addition, we note that the torsion tensor is now seen to be given by

$$\tau_\mu = -\frac{1}{2} l e^{-\varphi} R_{\mu\nu} \xi^\nu$$

or, alternatively,

$$\tau_\mu = -\frac{1}{2} l e^{-\varphi} R_{\mu\nu} g^{\nu\lambda} \partial_\lambda \psi$$

In other words,

$$\tau_\mu = -\frac{1}{2} \frac{l}{\sqrt{1+M\psi}} R_{\mu\nu} g^{\nu\lambda} \partial_\lambda \psi$$

Hence, the second generalized Bianchi identity finally takes the somewhat more transparent form

$$\bar{\nabla}_\nu \left(R^{\mu\nu} - \frac{1}{2} g^{\mu\nu} R \right) = -\frac{2}{3} l e^{-\varphi} \left(R^{\mu\nu} R_{\nu\rho} - \frac{1}{2} R R^\mu_\rho \right) g^{\rho\sigma} \partial_\sigma \psi$$

i.e.,

$$\bar{\nabla}_\nu \left(R^{\mu\nu} - \frac{1}{2} g^{\mu\nu} R \right) = -\frac{2}{3} \frac{l}{\sqrt{1+M\psi}} \left(R^{\mu\nu} R_{\nu\rho} - \frac{1}{2} R R^\mu_\rho \right) g^{\rho\sigma} \partial_\sigma \psi$$

5. Final Remarks

The present theory, in its present form, is still in an elementary state of development. However, as we have seen, the emergence of the electromagnetic field from the quantum evolution of the gravitational field is a remarkable achievement which deserves special attention. On another occasion, we shall expect to expound the structure of the generalized Einstein's equation in the present theory with a generally non-conservative energy-momentum tensor given by

$$T_{\mu\nu} = \pm \frac{c^4}{8\pi G} \left(R_{\mu\nu} - \frac{1}{2} g_{\mu\nu} R \right)$$

which, like in the case of self-creation cosmology, seems to allow us to attribute the creation and annihilation of matter directly to the scalar generator of the quantum evolution process, and hence the wave function alone, as

$$\bar{\nabla}_\nu T^{\mu\nu} = -\frac{2}{3} \frac{l}{\sqrt{1+M\psi}} T^{\mu\nu} R_{\nu\rho} g^{\rho\sigma} \partial_\sigma \psi \neq 0$$
